

Shoreline Habitat

The Habitat Type provides a simplified picture of the "look" of the unit overall, based on the detailed biophysical attributes that have been mapped. The Habitat Type category is a summary of the observations of both the unit's biological and geomorphological features.

Each Habitat Type has a definition that includes the typical substrate, wave exposure and biobands. For example, for the Semi-exposed, Immobile substrate Habitat Type, part of the definition of that class is a certain combination of the most likely

Semi-exposed, Immobile substrate Habitat Type, part of the definition of that class is a certain combination of the most likely biobands and indicator species present at a bedrock shoreline with no mobile sediment present.

Each Habitat Type has typical biological features (including both an indicator species list and a description of the habitat).

To determine the Habitat Type, the biomapper looks at the along-shore Units as designated
 1. records the observations of the biobands in the unit and looks for indicator species,
 2. assigns a bio (wave) exposure category

2. assigns a bio-(wave) exposure category,
3. reviews the physical mapped information, and

3. reviews the physical mapped information; and
4. assigns the Habitat Type that best describes the unit.

The Habitat Type is based on the whole unit and is similar to the physical mappers use of the

detailed across-shore data are summarized into one attribute. The simplified category describes

Habitat Type is a summary of the biophysical classification of the whole shore unit, based on:

- the blobbands observed,
- the wave exposure as indicated by the bands, and
- the substrate type in the site.

- the substrate types in the unit.

Legend Definitions

CC - Coastal Classification number

Wave Exposure

Wave Exposure
E - Exposed - Very high wave exposure, open ocean swellsm usually fetches >500km

VE - Very Exposed - Extreme high wave exposure
SE - Semi Exposed - High wave exposure, open shorelines, areas between fully exposed areas

SE - Semi Exposed - High wave exposure, open shorelines, areas between fully exposed and sheltered bays
P - Protected - Low wave exposure, sheltered inlets, usually fetches less than 10km
SP - Semi Protected - Moderate wave exposure, partly sheltered, usually fetches 10-50km

SP - Semi Protected - Moderate wave exposure, partly sheltered, usually fetches 10-50km
VP - Very Protected - Very low wave exposure, fetches <1km, sheltered anchorages at head
