

# Shoreline Habitat

The Habitat Type provides a simplified picture of the "look" of the unit overall, based on the detailed biophysical attributes that have been mapped. The Habitat Type category is a summary of the observations of both the unit's biological and geomorphological features.

Each Habitat Type has a definition that includes the typical substrate, wave exposure and biobands. For example, for the

Each Habitat Type has a definition that includes the typical substrate, wave exposure and biobands. For example, for the Semi-exposed, Immobile substrate Habitat Type, part of the definition of that class is a certain combination of the most likely high-tide substrate, wave exposure and biobands with immobile substrate.

Each Habitat Type has a definition that includes the typical substrate, wave exposure and biobands. For example, for the Semi-exposed, Immobile substrate Habitat Type, part of the definition of that class is a certain combination of the most likely biobands and indicator species present at a bedrock shoreline with no mobile sediment present.

## How is Habitat Type determined?

Each Habitat Type has typical biological features (including both an indicator species list and typical associated biobands). To determine the Habitat Type, the biomapper looks at the along-shore Units as designated and described by the physical mapper, and

To determine the Habitat Type, the biomapper looks at the along-shore Units as designated and described by the physical mapper, and 1.□records the observations of the biobands in the unit and looks for indicator species,

- 1.□ records the observations of the biobands in the unit and looks for indicator species,
- 2.□ assigns a bio-(wave) exposure category,
- 3.□ reviews the physical mapped information, and

3. ☐ reviews the physical mapped information, and
4. ☐ assigns the Habitat Type that best describes the unit.

The Habitat Type is based on the whole unit and is similar to the physical mappers use of the 'Coastal Class' category, in that the

The Habitat Type is based on the whole unit and is similar to the physical mappers use of the 'Coastal Class' category, in that the detailed across-shore data are summarized into one attribute. The simplified category describes the features of the whole unit.

Habitat Type is a summary of the biophysical classification of the whole shore unit, based on:

Habitat Type is a summary of the biophysical classification of the whole shore unit, based on:

- the biobands observed,

- the wave exposure as indicated by the bands, and
- the substrate types in the unit

- the substrate types in the unit.

Legend Definitions  
CC - Coastal Classification number

CC - Coastal Classification number

**Wave Exposure**  
E - Exposed - Very high wave exposure, open ocean swell, usually fetches >500km

E - Exposed - Very high wave exposure, open ocean swell usually fetches >500km  
VE - Very Exposed - Extreme high wave exposure

SE - Semi Exposed - High wave exposure, open shorelines, areas between fully exposed and more sheltered, usually fetches 50 to 50km  
P - Protected - Low wave exposure, sheltered inlets, usually fetches less than 10km

P - Protected - Low wave exposure, sheltered inlets, usually fetches less than 10km  
SP - Semi Protected - Moderate wave exposure, partly sheltered, usually fetches 10-50km

VP - Very Protected - Very low wave exposure, fetches < 1km, sheltered anchorages at heads of bays and inlets
