CC	Type
Rock Shore Types - characterized by a lack of clastic sediments such as gravel or sand.	
1	Rock Ramp, Wide
2	Rock Platform, Wide
3	Rock Cliff, Narrow
4	Rock Ramp, Narrow
5	Rock Platform, Narrow
Rock and Sediment Shore Types - rock and pockets of clastic sediments	
6	Shore with Gravel Beach, Wide
7	Platform with Gravel Beach, Wide
8	Shore with Gravel Beach, Narrow
9	Platform with Gravel Beach, Narrow
10	Shore with Sand and Gravel Beach, Wide
11	Platform with Sand and Gravel Beach, Wide
12	Shore with Sand and Gravel Beach, Narrow
13	Platform with Sand and Gravel Beach, Narrow
14	Shore with Sand Beach, Wide
15	Platform with Sand Beach, Wide
16	Shore with Sand Beach, Narrow
17	Platform with Sand Beach, Narrow
18	Shore with Sand Beach, Wide
19	Platform with Sand Beach, Wide
20	Platform with Sand Beach, Narrow

Shoreline Habitat

The Habitat Type provides a simplified picture of the "look" of the unit overall, based on the detailed biophysical attributes that have been mapped. The Habitat Type category is a summary of the observations of both the units biological and geomorphological features.

Each Habitat Type has a definition that includes the typical substrate, wave exposure and biobands. For example, for the Semi-exposed, Immobile substrate Habitat Type, part of the definition of that class is a certain combination of the most likely biobands and indicator species present at a bedrock shoreline with no mobile sediment present.

How is Habitat Type determined?

Each Habitat Type has typical biological features (including both an indicator species list and typical associated biobands). To determine the Habitat Type, the biomapper looks at the along-shore Units as designated and described by the physical mapper, and

- 1..records the observations of the biobands in the unit and looks for indicator species,
- 2.. assigns a bio-(wave) exposure category,
- 3.. reviews the physical mapped information, and
- 4.. assigns the Habitat Type that best describes the unit.

Habitat Type is based on the whole unit and is similar to the physical mappers use of the 'Coastal Class' category, in that the detailed across-shore data are summarized into one attribute. The simplified category describes the features of the whole unit.

Habitat Type is a summary of the biophysical classification of the whole shore unit, based on:

- the biobands observed,
- the wave exposure as indicated by the bands, and
- the substrate types in the unit.

Legend Definitions

CC - Coastal Classification number

Wave Exposure

- E - Exposed - Very high wave exposure, open ocean swells usually fetches >500km
- VE - Very Exposed - Extreme high wave exposure
- SE - Semi Exposed - High wave exposure, open shorelines, areas between fully exposed and more sheltered, usually fetches 50 to 500km
- P - Protected - Low wave exposure, sheltered inlets, usually fetches less than 10km
- SP - Semi Protected - Moderate wave exposure, partly sheltered, usually fetches 10-50km
- VP - Very Protected - Very low wave exposure, fetches < 1km, sheltered anchorages at heads of bays and inlets

Table MIDCOAST and NORTH COAST project area which includes BCO AREAS CC, JS and NC. The Species/wave exposure/ substrate table for Habitat Classification (HAB, OBS), for the Mid-coast BC study area, from Johnstone Strait/Central Coast Mapping Regions 5, 6 and 7.
